environment and weather adjust. Plastics are one of the major threats to marine life, ecosystems and human health. Right now, we dump millions of tonnes of plastic waste into our oceans where it causes untold damage to wildlife and enters the food chain. The regulations themselves would both limit plastic production and require companies to invent new ways of making goods more sustainable. The countries that have already instilled these measures, for example the prohibiting of single-use plastics are recognising a sizeable reduction uprising in environmental pollution. The move to eco-friendly materials also has economic advantages, creating jobs in the field of green industries. In adopting stricter plastic regulations, we move a step closer toward preserving our planet for generations to come. This is not just an environmental issue, it is a moral imperative that requires immediate action from both governments and industry. THISISI EHRE RI MA TYPINGDOT
